

Procedures using Regenexx injectates use your body's natural healing abilities to help repair damage to bones, muscles, cartilage, tendons, and ligaments.

## Why we use Regenexx injectates:

-  Reduce pain and improve function without surgery.
-  Concentrations of your own cells are customized for your specific condition or injury.
-  Injection-based procedures are performed with image guidance such as ultrasound and fluoroscopy.
-  Avoid prescription medications and invasive surgical techniques.
-  Minimize time off from work and away from activities or sports.

## Regenexx SCP Injectate

Super Concentrated Platelet Rich  
Plasma & Platelet Lysate Procedures

Regenexx SCP injectate is blood platelets, which contains growth factors.

Platelet rich plasma (PRP) and platelet lysate (PL) are blood platelet procedures that contain healing growth factors which promote your body's natural ability to repair itself.

Regenexx SCP injectate is an advanced platelet procedure that is more concentrated and purer than PRP created by the automated machines used at most non-Regenexx clinics, increasing its ability to stimulate the body's natural healing response.

Like all procedures using Regenexx injectates, they are performed with advanced image guidance to ensure the most accurate placements of cells into the desired area.

**Regenexx injectates, produced using Regenexx lab processing, routinely achieve 20x concentration —**

*far above what non-Regenexx providers achieve.*

**Concentrations of your own cells are customized for your specific condition or injury.**

Regenexx's proprietary, research-based methods and lab processing allow us to concentrate your cells and apply them precisely to your injured area.

Injection-based procedures are performed with image guidance such as ultrasound and fluoroscopy.

Procedures using Regenexx injectates can be used to treat a wide range of orthopedic conditions. Platelet procedures are commonly used for soft tissue injuries, mild arthritis, spine conditions, and around nerves.

The goal of the procedure is to reduce pain and improve function by promoting the body's own ability to heal naturally.

Your physician will evaluate your condition and your imaging to determine whether a platelet-based or bone marrow concentrate treatment is the best option for your orthopedic condition.

Patients often characterize Regenexx's non-surgical treatment options as "stem cell" or "regenerative medicine" procedures using Regenexx lab processes. For more information about these terms and how Regenexx defines them please visit: <https://regenexx.com/our-approach/stem-cells/>

Procedures using Regenexx injectates have a success and failure rate. The Regenexx® Provider Patient Registry tracks patients' progress or side effects, post-procedure using Regenexx injectates. To explore the outcomes database and see the number of currently tracked procedures as well as patient-reported results please visit: <https://regenexx.com/results/>
